The complete genome sequence of Escherichia coli K-12.";

Science 277:1453-1474(1997).

C-1-EVINCTION: THE GLYCINE CLEAVAGE SYSTEM CATALYSES THE DEGRADATION OF GLYCINE. THE PROTEIN BINDS THE ALPHA-AMINO GROUP OF GLYCINE.

THROUGH ITS PYRIDOXAL PHOSPHATE COFACTOR; CO(2) IS RELEASED AND THE REMAINING METHYLAMINE MOIETY IS THE THEN TRANSFERRED TO THE LIPOAMIDE COPACTOR OF THE H PROTEIN.

C-1-CATALYTIC ACTIVITY: GLYCINE + LIPOYLPROTEIN = S-AMINOMETHYL-DIHYDROLIPOYLPROTEIN + CO(2).

C-1-CATALYTIC ACTIVITY: GLYCINE + LIPOYLPROTEIN = S-AMINOMETHYL-DIHYDROLIPOYLPROTEIN + CO(2).

C-1-CATALYTIC ACTIVITY: GLYCINE CLEAVAGE SYSTEM IS COMPOSED OF FOUR PROTEINS:

C-1-SIBUNIT: THE GLYCINE.

C-1-INDUCTION: BY GLYCINE.

C-1-SIMILARITY: TO OTHER GLYCINE CLEAVAGE SYSTEM P-PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. "Amino acid sequence of the phosphopyridoxyl peptide from P-protein of the chicken liver glycine cleavage system.";
Blochem. Blophys. Res. Commun. 149:621-627(1987).

- I- BUCKLINE. THE GLYCINE CLEAVAGE SYSTEM CATALYSES THE DEGRADATION OF GLYCINE. THE REVAINING METHYLAMINE MOIFTY IS THE THEN TRANSFERRED TO THE THE REMAINING METHYLAMINE MOIFTY IS THE THEN TRANSFERRED TO THE LIPOAMIDE COPACTOR, CO(2) IS RELEASED AND THE REMAINING METHYLAMINE MOIFTY. IS THE THEN TRANSFERRED TO THE LIPOAMIDE COPACTOR OF THE H PROTEIN.

- CATALYTIC ACTIVITY: GLYCINE + LIPOYLPROTEIN = S-AMINOMETHYL-
DIHYDROLIPOYLPROTEIN + CO(2).

- COFACTOR: PYRIDOXAL PHOSPHATE.

- SUBUNIT: HOMODIMER: THE GLYCINE CLEAVAGE SYSTEM IS COMPOSED OF THE FOUR PROTEINS: P, T, L, AND H.

- SUBCELLULAR LOCATION: MITOCHONDRIAL.

Submitted (JAN-1995) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THE GLYCINE CLEAVAGE SYSTEM CATALYSES THE DEGRADATION OF
GLYCINE. THE PERCEIN BINDS THE ALPHA-AMING GROUP OF GLYCINE
THROUGH ITS PRIDOXAL PHOSPHATE COFACTOR; CO(2) IS RELEASED AND
THE REMAINING METHYLAMINE MOIETY IS THE THEN TRANSFERRED TO THE
LIPOAMIDE COFACTOR OF THE P PROTEIN.
-!- CATALYTIC ACTIVITY: GIXCINE + LIPOYLPROTEIN = S-AMINOMETHYL-
DIHYDROLIPOYLPROTEIN + CO(2).
-!- CORCTOR: PYRIDOXAL PHOSPHATE (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: MITCOGHONDRIAL (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: MITCOGHONDRIAL (BY SIMILARITY).
                                                                                                                                 Sinclair D.A., Dawes I.W.; "Genetics of the synthesis of serine from glycine and the utilization of glycine as sole nitrogen source by Saccharomyces cerevisiae."; Genetics 140:1213-1222(1995).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oxidoreductase; Mitchondrion; Pyridoxal phosphate; Transit peptide.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 8
E75352
glycine cleavage system P protein - Deinococcus radiodurans (strain R1)
C;Species: Deinococcus radiodurans
C;Satersion: P5352
R;White, O.; Eisen, J.A.; Heidelberg, J.F.; Hickey, E.K.; Peterson, J.D.; Dodson, R.J.;
M.; Shen, M.; Vamathevan, J.J.; Lam, P.; McDonald, L.; Utterback, T.; Zalewski, C.; M.; Snith, H.O.; Venter, J.C.; Fraser, C.M.
Science 286, 1571-1577, 1999
A;Tille: Genome sequence of the radioresistant bacterium Deinococcus radiodurans R1.
A;Reference number: A75250; MUID:20036896
A;Accession: E75352
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-494 cMHI>
A;Cross-references: GB:AE002021; GB:AE000513; NID:g6459573; PIDN:AAF11360.1; PID:g645958
A;Gene: DR1809
A;Map position: 1

R) Stephens, R.S.; Kalman, S.; Lammel, C.J.; Fan, J.; Marathe, R.; Aravind, L.; Mitchell, Solence 282, 754-759, 1998

A) Title: Genome sequence of an obligate intracellular pathogen of humans: Chlamydia track A) Accession: E71551

A) Accession: E71551

A) Accession: E71551

A) Molecule type: DNA

A) Residues: 1-507 ARN>

A) Conserreferences: GB:AE001288; GB:AE001273; NID:g3328545; PIDN:AAC67739.1; PID:g332854

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated
                   or antegonists (Tb) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunchlerapy (i.e. to prevent attack on normal but generated a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
           present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         T cell epitope; immune response; human leukocyte antigen; HLA Class I; vaccine; immunogenic; major histocompatability complex; MHC; B cell; disease; anti-tumour; anti-viral.

with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide W39723 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human MHC Class I allele HLA-A2.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The peptide epitope W77119-W77138 were created for human tumour-specific cytotoxic T lymphocyte response. These peptides are are cysteinedepleted mutants of a native disease-specific CTL epitope. The cysteinedepleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive

                                                                                   Sequences shown in W70044 to W70052 represent peptides derived from carcinoembryonic antigen (CEA). The peptides can bind to a human leukocyte antigen (HEA), HLA-A2.1 and are used to examplify the method of invention of producing antigen-specific cytotoxic T cells (CTLS) in vitro. The method comprises contexting immunogenic peptides from an antigen that binds class I major histocompatibility complex (MHC) antigen presenting cells (APCS) pretreated with corrections with antigen presenting cells (APCS) pretreated with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLS. A method for specifically killing crarget cells in a human patient is also provided which comprises charget cells in a human patient is also provided which comprises charget cells with APCS pretreated with pre-treatment growth factors, where the APCS comprise class I MHC molecules. The pretreated APCS are incubated with the cytotoxic growth factors, thereby producing activated cCC composition can then be administered to the patient. The activated cCC can be used for treating cancers, immune disorders, viral infections, ALDS, hepatitis, bacterial infection, fungal infection, malaria or
                                                                                                                                                                                                                                human leukocyte antigen; HLA; tumour associated antigen; cancer; antigen presenting cell; APC; immunogenic peptide; immune disorder; viral infection; AIDS; hepatitis; bacterial infection; malaria; CEA; fungal infection; tuberculosis; melanoma; carcinoembryonic antigen.

having a human major histocompatibility complex (MHC) Class I (also having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CE HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cesponse against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) crop prevent viral infections and cancers in mammals (especially humans) crop prevent viral infections as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      or artagonists (1b) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating asstrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use im adoptive transfer therapy. (Ib) are used to inhibit CEA specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunogenic peptide having a human leukocyte antigen binding motif #1166.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                           immune response; carcinoma; gastrointestinal; breast; pancreatic; bladder; ovarian; lung; prostatic; T cell proliferation; cancer; adoptive transfer therapy; autoimmune reaction; immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide agonists and antagonists of carcinoembryonal antigen
                                                                                                                                                        Carcinoembryonic antigen; CEA; human; agonist; antagonist;

Carcinoembryonic antigen fragments – used in assays to determine the presence and amt. of the antigen in samples also contg. related antigens.
                                                                                                                                                                                                                                                                                       CEA fragments can be used in assays to determine the presence and amt. CEA in samples which also may contain related antigens including its normal cross-reacting antigen or the 128 kD antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                 proteins. The method comprises determining at least part of the amino acid sequence of the protein: (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The immunoglobulins on theraputic proteins. •9. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the protein sequence of vaccine 2 708 VI.
                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for the production of non-immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                      Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells of a given species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

                                                                                                                                                                                                             portions of human biliary glycoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The sequences given in R77435-38 are chimaeric proteins comprising portions of human biliary glycoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they append and the imaging and treatment of cells exhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primer; amplify; polymerse chain reaction; PCR; human; blilary glycoprotein; BGP; membrane-bound; carcinoembryonic antigen; CEA; chimmeric protein; PRLA3 epitope; anti-PRLA3 antibody; colorectal carcinoma; monoclonal antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New molecules which bind carcinoembryonic antigen - used for the diagnosis and treatment of colorectal carcinoma and for isolation and purifications.

The sequences given in R77435-38 are chimaeric proteins comprising portions of human biliary glycoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they append to the imaging and treatment of cells exhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             R00619. CEA is free from cross-reactive CEA-like antigens, it is antigenically indistinguishable from the solution form of CEA shed from tumour cells, and it is devoid of ethanolamine. R60619 can be used in a reagent composition for detecting neoplastic diseases in blological samples, or in an immunoasay process where it can specifically detect the presence of tumour cells in a biological sample e.g. blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                  indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the
                                                      The sequences given in R77435-38 are chimaeric proteins comprising portions of human biliary glycoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies

The baculovirus signal peptide directs translation of rCEA into the insect cell glycosylation pathway. rCEA can be produced at high levels in Sf900+ insect cells grown in serum-free media, and isolated to a purity of over 95%. It is used as an immunogen in humans to protect against cancer, partic. breast,
